The giant intrathoracic meningioma: a surgically feasible approach. Intrathoracic meningiomas have received little attention in the orthopedic literature. We present a retrospective review of 11 patients with intrathoracic meningiomas who were treated at our institution. Three patients presented with recurrent tumors. Fourteen patients were treated by en bloc resection, seven of whom had presented with symptomatology. Three patients underwent partial resection due to tumor size and were observed closely. The symptoms of the majority of patients were related to the intracranial lesions. Three patients had segmental spinal cord dysfunction, which caused neurogenic bladder or bowel. Only two patients had preoperative complications. All patients had immediate relief of symptoms. Six patients had neurological improvement postoperatively. The mean length of the surgical procedure was 7.4 hours. One patient died of complications after surgery. One patient had intraoperative rupture of the tumor capsule during total resection. In nine of 10 patients who had long-term followup, the disease was controlled by surgery alone.

capacity. A scroll compressor has been proposed which comprises a scroll-form compression mechanism including first and second scroll members and having a pair of compression chambers formed therein, and a suction chamber which communicates with an evaporator. A first refrigerant passage connects the suction chamber with the first chamber of the compression mechanism, a second refrigerant passage connects the second chamber with the suction chamber, and a third refrigerant passage connects the first chamber with the second chamber. The compression mechanism is driven to reduce the pressure of a refrigerant in the first chamber while it is operated and then to reduce the pressure of the refrigerant in the second chamber while it is driven. With this construction, the pressure of the refrigerant in the first chamber is introduced into the second chamber when the pressure of the refrigerant in the first chamber becomes higher than a predetermined value and the compression mechanism is operated. When the compressor is operated while the refrigerant flows through the evaporator,
