Anti-inflammatory action of aminophylline and cAMP. Prostaglandins are known to be potent mediators of inflammation and recent studies suggest that phosphodiesterase-inhibitors might be useful in inflammation. The present study was undertaken to investigate the effect of the phosphodiesterase inhibitor aminophylline on oedema and inflammation evoked by carrageenin in the hind paw of rats. As a measure of inflammation, we have measured the swelling of the hind paw induced by carrageenin in normal and aminophylline-treated rats. Aminophylline significantly suppressed carrageenin-induced paw oedema. The mechanism of this action was examined by measuring the production of prostaglandin E2 and prostacyclin (PGE2, PGI2) and by determining the cyclic AMP content in the paw tissue. Aminophylline increased the cyclic AMP content in the paw tissue. The effect of aminophylline on carrageenin-induced inflammation was not reversed by the cyclic AMP antagonist, R-p-chlorophenylthio-cAMP. The results suggest that the anti-inflammatory effect of aminophylline may be due to increased cyclic AMP content.

different methods than those with a convex hull of a genus-5 triangulation. Consider the processes in Figures \[fig:t-lc\] and \[fig:t-lc-tc\] as to how a triangulation can be transformed into the triangulation of a genus-5 surface. Then we apply the method illustrated in the red-shaded region in Figure \[fig:genus5\]. For both the triangulation and the curve shown in Figure \[fig:genus5\], the maximally permissive surface remains the same, but the polyhedral surfaces become concave by deforming. Extending the Method to Genus-6 {#sec:genus6}

===== For the genus-6 triangulation, we need to label the vertices with an integer between \$1\$ and \$6\$. In that case, we use the method illustrated in Figure \[fig:genus6\]. Note that it is easy to see that this does not affect the maximally
