PE Explorer is a program for Windows operating systems and allows you to analyze the format and

layout of the Portable Executable file. PE Explorer provides a Windows interface that you can use to view the raw machine code of a PE file, which is invaluable for analysis and debugging. When reading the machine code of a PE file, you can display the position of each instruction. Also, it displays the bytes of the instruction and the fields of each instruction, such as: - Address - Type - Attributes - Size - Machine code PE Explorer enables you to analyze the machine code of a file using the above-mentioned functions. PE Explorer allows you to view the

layout of the file, display the full directory structure of the executable file, view and check the value of register, and debug the software. With PE Explorer, you can explore the executable file in any state (compressed, not compressed, disabled, etc.) and you can continue your work on the original file. You can also use other additional functions provided by PE Explorer. PkStrDec is a program for analyzing, decrypting and recovering encrypted strings. PkStrDec is written to be as user-friendly as possible, so that you can use it for quickly decrypting any

string. PkStrDec allows you to extract the key from a string or pass on the key from the string to a third-party application. You can select only a part of the decrypted string or the entire string. PkStrDec has options to enable or disable character swapping, which allows you to get the exact string. The Swapped Character option can be also selected in the configuration. PkStrDec is a useful utility that is not limited to decrypting strings, but it can be used for recovering text, files and any other type of data. Windows Firewall Utility is a small, fast and easy to use

Windows Firewall utility. The program adds the most common firewall rules to your computer automatically. Windows Firewall Utility also allows you to create custom rules, so you can use your own customized rules for all Windows Firewall A program to create a Windows startup shortcut. What is UPX (or UPX is a tool for packer executables, it is written in C, and is currently maintained by Marc Leblanc) The main advantage of UPX: Since the loader (LZMA SDK) is the same, the executable and the library (.dll) will be the same size, and the unpacking (used for the decompression) will be more efficient. But it's more than that, it's much more than that: What makes UPX a good system for packing and unpack processes: It is the smallest system (when compared to the most

used systems (Gzip and Tar)) It is the simplest For more information, the FAQ and the source of UPXGui are available **DOWNLOADING** You can download this software from our website (link at the top right of this page) or the main website of LodeRock Documentation, download and some help: Full documentation in doc or man format is available on the UPX website. Documentation in man format is available in the doc folder of the zip file. The manual of UPXGUI is available in the user manual (user.pdf) You can get help on a specific section by clicking on the

link help which is available in the bottom of the page. You can get help on the whole page or on a specific page by clicking on the corresponding link which is available in the top of the page.

**USER MANUAL:** The manual of UPXGUI is called user.pdf. It is a manual which will be used to help you to use the software. This manual is not available in doc format. We are sorry for this but the reason is that it is the only way to directly access to the code to fix an error, or to add a new feature.

**SOME BUGS:** I have reported some bugs (or I found some bugs) in the

source code but unfortunately I can't help you on this because the code is not available. Some bugs are fixed in a newer version of UPXGUI (a lot of new features and improvements). You can find these bugs and their statuses in the repository: If you find a bug, you can report it. You can report it on the main repository on GitHub or on the repository of the

## What's New in the?

UPXGUI is a graphical interface for UPX (packer for executables).

UPXGUI uses the version 2.03 of UPX. UPXGUI is used to compress Windows 32-bit executables or DLLs. Very useful to reduce the the size of your software distribution. UPXGUI is also easy-to-use, small and simple. UPXGUI has support for almost all archive formats (with some exceptions such as bz2 or arj), EXE, DLL, ZIP, TAR, ZIP64, LZMA and LZ4. UPXGUI has a powerful mode that compresses the file using UPX

(or other packer) and compress as much as possible as explained here. If you pack the file using UPX, you will have to add `-DUPXCOMP=on` to command line to use it. UPXGUI also include an EXE Unpacker to decompress an EXE file. UPXGUI uses Graphics32 library with a console port provided by GTK+. When the user presses a button, an icon is created using the Gdk-Pixbuf library. This library use icons to represent files and directories. You can change the icon, the name, the size, etc. using the `IconChooserWidget` or the

UserIconChooserWidget. UPXGUI uses GTK+ 3.4.4 to have a GNOME 3 look and feel. The icons of this theme can be changed using this packer GUI. You will have to use it when the icon of your archive is a.svg or.xpm file. UPXGUI is also compatible with Windows 8.0 and older versions. UPXGUI allows a list of icons to be customized. UPXGUI is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.
