Adobe Photoshop Elements, as an add-on to Photoshop, will automatically create a zipped archive of your images that enables you to open them and edit them using the iPad Pro and Apple Pencil. You'll be able to edit individual images, rename them, crop them, and color-balance shots if you choose to. You can can even covert family photos into "sketch art" (using automatic sketch detection and Sketch smart layers), among other interesting things. Photoshop Elements won't perform all of the same functions as Photoshop, but the fact that the software is "there" for you is one of its greatest appeals. Like the iPhone 7, the iPad Pro doesn't have the best cameras, but it's still capable of producing sharp images. Creative Cloud is currently powered by a web-based equivalent of Photoshop Elements. This enables you to make adjustments to your graphics right from your browser! One of the things that customers and Adobe alike like most about Photoshop is the ability to create, organize, and share their files in their browser, or even

outside of the applications they use most. Yet, it has been a pain. An evolution to the browser is a great idea in theory, but when its not executed well, it hurts the user experience. While part of the problem was a result of using the traditional OS file manager for a while, a lot of it was related to web browser security policy changes. Just two weeks ago, Chrome made browser extensions disabled by default in all extensions. This may affect how some people work, and if we're being honest, it may prevent a good number of people from using several popular online services and features.
