You can pick individual colors in the image and use the sliders to adjust the Highlights, Midtones, Shadows, and Whites. If you zoom in, you'll see that Photoshop truly emphasizes adjustment of whites, and it groups white into separate boxes, making it even easier to see what the white settings do when adjusting. However, when it comes to white, I think you really need to address the Midtones and Shadows to ensure that black doesn't become too dark or too light. I'd add some color to my whites and Midtones as well, however, since the image has nice skin tones – an easy fail with horribly over-whitened and too-blued undertones. By the way, white doesn't work the same in most images. Most skin tones should have a little red transition from light to dark, otherwise they are very difficult to see. However, just by looking at a series of images with different white settings, you can see that Photoshop really pushes the boundaries as far as tonal range. I've stopped using a histogram to fine-tune images, and I've just left Photoshop in "judicious preview" mode. Photoshop really comes into its own when arranging layers. Once you select an area to work with, you can arrange groups of Layers underneath other Layers, and you can add or delete layers, selecting pixels and moving Layers as you like. You'll need a lot of folders to store images, or you'll put them all in the one folders. Either way, it's not easy to keep track of which photos belong where, especially since Photoshop allows you to work with layers in every combination of the three modes: RGB Color, Grayscale, and Grayscale Transparency.
