

SteinP 3DT Incl Product Key

[Download](#)

Geotechnical engineers, civil engineers and landscape architects use 3-dimensional modeling software to produce 3-D models of many different kinds of structures such as highways, dams, buildings, canals, bridges, railway... The SteinP 3DT software is a

great geotechnical engineering solution for laying out, designing, drafting and calculating loads of all types of construction projects. SteinP 3DT has become the de facto standard in the field of geotechnical engineering.

Features: Accurate computation of Ground Loads for underground and

aboveground
projects - The
geotechnical
engineering software
SteinP 3DT, is
primarily used for
the following types of
projects: >

Underground and
underground
excavations >

Aboveground
construction > Green
energy projects >

Railway engineering
> Industrial projects

> Geotechnical investigations The following methods of computation are used:

- > Coulomb-Boussinesq-Mastrian-Hicklman
- > Poggendorff
- > Shear-slip
- > Settlement
- > Subsurface barrier
- > Proximity factors (exact formula)
- > Dispersion factors (exact formula)
- > Carbonation

formulas > Poisson's ratio > Synoptic, the surveyor's precision (three points) >

Synoptic, the surveyor's precision (four points)

Evaluation of stress factors - In this method, the values of stress factors can be obtained using the following formulae:

> European site: > $S = 4.04 * (a/b)^2 +$

a/b > Coastal site: >

$$S = 4.04 * (a/b)^2 + a/b$$

> International site: > $S = 6.21 * (a/b)^2 + a/b$

Drawing of Grids -

The software lets the user to create a grid of the construction site with different line types, different taper options and different numbers of sections. Designing and visualizing of footings - The user can create and

visualize a range of types of footings for underground and aboveground projects, including settlement, anchors, reinforcement, grids, piles, reinforcement, stiffeners, beams and cross sections.

Creating and visualizing of piles - Piles are represented as trapezoids which enable you to visualize the section,

the bearing capacity,
the toe and the heel
of

SteinP 3DT With License Code [April-2022]

SteinP 3DT is a
program that allows
you to quickly design
a footing plan based
on a given cross
section. SteinP 3DT
is a program that
allows you to quickly
design a footing plan

based on a given cross section. The program is built on the SteinP Design Engine. The SteinP 3D Design Engine is used for modeling of foundations and serves as the basis for the design modules of the following programs:

SteinP 2D 2D

Construction Planner

SteinP 2D 2D

Construction Planner

Description: A construction plan lets you build a structure on a given site. In this case you'd design the whole building with respect to the site and only afterwards you'd lay the foundation. This will allow you to better specify the dimensions of the site and keep track of the construction

costs. The construction plan consists of a plan, an elevation and a sketch. The construction plan has a toolbar, in which you can select the design elements of the site, including the survey and the definition of the subsoil layer and consolidation and subsidence. The design elements

include: The free space surrounding the building. The projection and section. The Heading vector. The Subsoil layer. The Class of foundation. The construction phase. The cost and the coordination. The Design of the building. The Projection of the building. The Section of the building. The

Sketch of the building. The Coordination of the building. The Finishing of the building. The Administrative structure of the construction plan. The part of the drawing that is not used for construction. The footprint. SteinP 2D 2D Construction Planner allows you to

create the construction plan directly on the basis of the prepared survey and the definition of the subsoil layers and the consolidation. The depth of the excavation is determined at the beginning. This allows you to avoid filling out the entire project with the site data. It also allows

you to set up the parameters for the construction and the costs, such as number of phases.

STEINP 2D 2D

Construction Planner

Description: SteinP

2D 2D Construction

Planner is a program

for the design of

foundations. STEINP

2D 2D Construction

Planner is a program

for the design of

foundations. If you're

looking to design
foundations and the
construction costs
for a building, SteinP
2D 2D Construction
Planner is the tool
you need

SteinP 3DT With License Key

SteinP 3DT is a quick and easy 3D FEM (finite element method) construction tool. It has user-friendly design tools, geo CAD data import features, and a powerful set of simulation features. The result is a simulation-based design tool with a focus on rapid

construction and
settlement analysis.

The simulations can
be used for: •

Earthquake and
landslide analysis:

For example, you can
perform specific

analysis on the Los
Angeles earthquake
or different landslide

slopes. • Multi-point
settlement analysis:

You can quickly draw
a two-point

settlement analysis

on a model that contains your building. • Ground settlement analysis: You can simulate ground settlement effects in your building. • Ground deflections and compressions: You can generate complete ground structure for your building. • Reinforced concrete elements: You can

define concrete elements for your floor, walls, columns, rebar, and more. It is possible to create 3D elements and to analyze their settlement. New in version 4.0 An innovative component of the new version is the new geometry modeling tool. This tool can be used to create complex 3D

shapes as well as to generate 3D solids from 2D drawings. These solids can be imported and can be used to create basic mechanical design. The tool also allows you to import and extract data for use in quick analytical calculations. The new 2D feature can be used for quick analysis of parts of the floor, walls, and

columns. To use this function, create a 2D and then a 3D object and then move the 2D object to a location where it will be used. You can then calculate floor deflections or displacements and move these values to any of your elements. The results of these calculations are displayed on the properties panel of

your objects. The new Quick Analysis mode can be used to generate analytical calculations. You can quickly construct a basic column model and use it to calculate floor deflections. The results are displayed in the properties panel. Important: If you use SteinP 3DT in its most basic mode, you can save a

considerable amount of time. However, if you use it for detailed calculations, you must use the more powerful analysis functions. Changes in version 3.9. The new release 3.9 is the result of SteinP 3DT users' requests. The most important addition is the possibility of importing new geo CAD data from

industry-standard
CAD formats. These
formats include: •
DWG • DWF

What's New in the?

SteinP 3DT looks to
be a useful tool in
geotechnical
engineering. This
branch of

engineering deals with soil and rock mechanics, or simply put, it studies the soil's behavior under stress factors like buildings or similar structures. SteinP 3DT should allow its users to perform settlement calculations based on what types of footing elements are in their proximity. The calculations appear

to be based on the DIN 4019 standard and Boussinesq's Equation. To start drawing the footing shapes, you find the Draw menu. Inside you'll find a rectangle footing, a circular one, and a random footing creator, which allows for more detailed designs. Regarding the calculations, there is a dedicated

menu on the toolbar. Inside you can find tools handy for calculating grids, watch points, section lines, and a couple of settings for altering these calculations. In addition, the application provides consolidation settlements derived from the 1-D theory of Terzaghi, subsoil strata definition in 3-D space, a way to

export projects as BMP or WMF. All things considered, SteinP 3DT is not everyone's cup of tea. Unless you are active in the geotechnical engineering field or look to learn its ways, this application has nothing to offer. We review the GEO4ESO - SWISS HELIOPLANNER. It
