

Ed Sheeran Plus iTunes Deluxe Edition 320kbps PRM3

Click once or use command line: where.exe win.ini in command line enter:
c:\windows\winsxs\x86_microsoft-windows-iis-10.0.16299-x64\installers\iis\iis.exe So this is already running on Windows Server 2008 R2. Applications that use appcmd.exe have an additional functionality that creates an Event Tracing for Windows, or ETW, logging for every action. By default, Event Viewer will register to a local or distributed Windows Event Log, meaning ETW tracing messages will automatically appear in its logs. ETW is a way to trace the system and show it to you in a better way. It can log all kinds of system events, such as events related to the registry, file system, program execution, and so on. ETW records this data for further review. When an application calls the appcmd.exe application, the system will log the level of the command and the return code. In the following example, the application is a PowerShell script that performs a remote login, attempts to install a web site, and logs the event data. Before you use appcmd.exe, we suggest you to open the Event Viewer. To open Event Viewer, click Event Viewer in the Start menu or type eventvwr in the search window. The Event Viewer provides more than one log. Because all the logs have the same name, start a simple search for a period of time. In the following example, you can use the period of time selection and a search for 2-6-2011. You can see in the following snapshot, that the Event Viewer logs the logon, an error, and an exit code. The next step is to configure appcmd.exe. This line is entered in the properties field of Event Viewer. To run appcmd.exe, enter the following line in the configuration file: appcmd.exe create "webvdir\webroot" /f /app.config /p:applicationRoot="c:\inetpub\wwwroot" Create or delete an existing event source. Enter the following in the configuration file to create an event source: appcmd.exe create "http\eventlog\myAppLogger" -applicationName MyApp -description "MyApp Event Logging" -enabled:\$true -sourceName "MyAppSource"
